Master's thesis project. Online. There are pre-requisites for the course: A. Theorem and Conjecture based problem solving. A. Linear Algebra 1 or Linear Algebra 2. A. Naive Algebraic Manipulation. B. Recasting Algorithms into the Mathematical Form of Algorithms. C. Project-based. D. Descriptive Linear Algebra. The Linear Algebra course is entirely project-based. Each student is responsible for all of their own work and has access to a tutor who is available on a one-on-one basis. View linear algebra cemal koc pdf pdf The course organizes in three parts, each dealing with a certain aspect of a university course in mathematics. The only literature required is from basic linear algebra topics. Students are expected to pursue basic linear algebra in preparation for more advanced topics. View linear algebra cemal koc pdf pdf The course is numbered using the standard mathematics numbering system. There is a summary of the course content on the course page. PDF and Video lectures are available. View linear algebra cemal koc pdf pdf Linear Algebra CEMAL KOC Pdf Pdf S1x 2x. $y=x^2$. Note that as x approaches $+2$, y approaches $+4$. MATH 362 LINEAR ALGEBRA II CHAP3 LINEAR ALGEBRA II A linear system of equations or a linear equation consists of two or more equations, one or more variables, and each must contain a known quantity in the linear combination. It is possible to solve the linear system in many ways, most notably, the augmented matrix method, Gaussian elimination and the Cramer's rule. The example below applies the Cramer's rule. View linear algebra cemal koc pdf pdf Due to the complexity of problems, most students have an intuitive sense of the solution. However, a proof based on mathematical rigor is often essential for students with no experience in such proofs. View linear algebra cemal koc pdf pdf Projects are required to be done in a group. All student materials are due on the dates specified. Resources include a linear algebra textbook, a grid, a dictionary of math terms, and worksheets. From To develop a more expansive and autonomous technology from which you can work productively, you need to understand the basic ideas and abstractions underlying linear algebra. This course will introduce you to concepts and techniques that you can use to make sense of large areas of science and technology. Our goal is to bring you a solid grounding in linear algebra: its origins, its central concepts and functions, and its deployment in useful applications. My hope is that when you leave this course, you will be able to apply the insights of linear algebra to your scientific or engineering work and to realize the potential of mathematical research in general. In particular, we shall focus on understanding and analyzing: linear transformations and their associated linear operators; matrices and their two important linear algebra properties: invertibility and surjectivity; and eigenvalues and eigenvectors. We shall also cover formal definitions of linearity, invertibility, multiplicity and the rank of a matrix, as well as the orthogonality of linear subspaces. This course is designed to provide you with the essential tools you will need to learn and apply linear algebra effectively and efficiently. Your individual experience and study, as well as your progress through the course, will lead you to the level of understanding that will help you apply linear algebra ideas to your work. As you work your way through the course, you will not only obtain an insight into linear algebra, but also an insight into the rest of mathematics as well, since linear algebra may be viewed as an abstraction of other aspects of mathematics. Therefore, we shall be particularly concerned with its connections to geometry, analysis, numerical analysis and probability theory.
