The present invention relates to a bicycle pump. More particularly, the invention relates to a bicycle pump which is attachable to the air-line hose of a bicycle in order to allow the cyclist to replenish air in the tires of his bicycle. While cycling, the cyclist tends to lose some of the air in the tires of his bicycle. This can result in the tire becoming flat. When this occurs, the cyclist is forced to stop and reinflate the tire. The cyclist must remove the air in the tire through the nipple located on the valve stem of the bicycle. This is a laborious task and one which has traditionally been ignored by cyclists. However, during the past several years, more and more cyclists have begun to replenish the air in their tires in order to ensure that their tires remain inflated as long as possible. In order to facilitate the replenishing of air in the tires of a bicycle, some types of bicycle pumps have been proposed which are attachable to the air-line hose of a bicycle in order to allow the cyclist to replenish the air in the tires of his bicycle. One type of bicycle pump which has been proposed includes a handle having a pair of pivotable levers which are connected to a strap which wraps around a bicycle. A cylindrical container is mounted on the strap, with the container having a piston which is movable in the direction of a valve stem located on a bicycle valve. The piston is connected to the levers of the handle through spring-loaded cylinders. When a cyclist turns the levers of the handle, the levers are pivoted, causing the piston to move. This motion of the piston forces air into the interior of

the cylindrical container. The air then forces the air out of the container through the valve stem, replacing the air in the tire. When the cyclist releases the lever of the handle, the spring-loaded cylinders pull the levers back to their original positions. As a result, the container retracts. Thus, this type of bicycle pump has the disadvantage that it can only be used with a bicycle on which a conventional valve stem is located. Further, this type of bicycle pump can only be used with an air-line hose with a conventional valve stem. This makes the pump inappropriate for use in conjunction with a bicycle equipped with an internal tire valve. Additionally, this 4bc0debe42
